Land deal performance reports

Public version, with synthetic numbers, of the analysis I did when buying and selling land: whether a plot is worth buying, whether to split it into lots or sell it whole, and when the money comes back.

WHAT IT SHOWS

- Every cost and every payment on a monthly calendar: purchase taxes, approvals, streets and utilities, upkeep, sales over the years and installments.
- For each plot: value created, return per year, the most cash needed at one time and the month the money is back, in a bad, an expected and a good case (final-report.pdf has the full tables).
- An investment note per plot written by Claude, kept only if every number in it matches the model.

HOW AI WAS USED

I use Claude (Claude Code and the API) for coding, review and documentation. The questions, modelling choices, validation and conclusions are mine.
